## A P P E A R A N C E S

FACILITATORS: Dave Fisher, Chairman  
Montana Public Service Commission  
Bob Rowe, Commissioner  
Montana Public Service Commission  
Nan Thompson, Commissioner  
Alaska Regulatory Commission

PANELISTS: Tony Herbert  
Dr. Lynn Churchill  
Colonel Michael McCabe  
Mike Strand  
Ron Warnick  
Geoff Feiss  
John Zauher  
Nellie Bandelier  
Larry Wetsit  
Frank Fifield

## 1 P R O C E E D I N G S

2

3 MR. FISHER: Good afternoon. I'm Dave Fisher, chairman  
4 of the Montana Service Commission. On behalf of the Montana  
5 PSC, I'd like to welcome you all to our beautiful state, or  
6 as we call it, Big Sky Country.

7 Today we're pleased to welcome representatives of  
8 the Federal Communications Commission and state Public  
9 Service Commissions, all of whom have been actively involved  
10 in the Federal-State Joint Conference on Advanced  
11 Telecommunications. Joining us here in Bozeman are some  
12 staff and federal leaders who have worked very hard on the  
13 706 Joint Conference. I'd like to recognize their  
14 participation in our Montana satellite hearing.

15 Montana Commissioner Bob Rowe. He's also chairman  
16 of NARUC, an ex officio member of the Joint Conference.

17 Alaska Regulatory Chair, Nan Thompson. Nan is also  
18 the Chair of the 706 Conference.

19 Emily Hoffnar from the FCC. Emily is also the  
20 primary federal staff of the Joint 706 Conference.

21 Jeff Richter, staff of the Wisconsin Public Service  
22 Commission. Jeff is also Chair of the state staff working  
23 on the 706 Joint Conference.

24 Bonnie Lorang from the Montana PSC is a staff  
25 member of the 706 State Conference group.

Heritage Reporting Corporation  
(202) 628-4888

1           We also have with us from Montana Nancy McCaffrey,  
2 Vice-chair of the Montana Commission; Commissioner Gary  
3 Feland; and Commission staff Jay Driscoll, and Commission  
4 staff Rhonda Simmons. And on behalf of the Montana  
5 Commission, I'd like to express a sincere thank you to our  
6 staff for putting this together and the hours they've put on  
7 it. I think they've done an excellent job.

8           I'd also like to give a special thank you to  
9 VisionNet, who I understand has put in countless hours and  
10 is providing this -- their services to us free of charge, so  
11 thank you for that.

12           We appreciate the opportunity to host this Montana  
13 satellite collaborative, which we hope will showcase the  
14 status of advanced services deployment in our wonderful  
15 state. We also would like to welcome our co-hosts, the  
16 Wyoming and South Dakota Public Service Commissions, who  
17 have also been working very hard to make the Mountain West  
18 Regional Hearing a success.

19           Not only do we hope to provide a forum for today's  
20 panelists, but an opportunity to display many of the  
21 exciting advances happening in the world of  
22 telecommunications here in Montana.

23           In a moment we will hear representatives of  
24 government, small rural telephone companies, and Montana  
25 communities sharing with us stories of their efforts and

1 challenges to bring advanced services to communities in  
2 rural Montana. We hope that their experiences will not only  
3 demonstrate what access to advanced services means to rural  
4 states like Montana, but what can be done to promote further  
5 deployment of advanced services in rural America.

6           It is our hope you will remember your experience in  
7 Montana as we work together to ensure that rural America is  
8 not forgotten as we move forward in connecting all of  
9 America with advanced telecommunications services.

10           We're especially pleased that we are able to  
11 showcase in realtime one example of the exciting inroads  
12 Montana companies have been making in bringing advanced  
13 services to Montana. This Bozeman hearing is being web  
14 streamed and video broadcast to the Montana communities of  
15 Glasgow, Pablo, and Billings, as well as to the Little  
16 America Hotel in Cheyenne, Wyoming, by a consortium of small  
17 rural companies who through collaborative efforts are  
18 providing broadband service to Montana.

19           Through this interactive video broadcast by  
20 VisionNet, Incorporated and the Wyoming State  
21 Telecommunications Network, participants in four remote  
22 locations will be able to join us and share comments and  
23 questions throughout the day.

24           Reasonable access to advanced services is vital to  
25 the economic survival of rural America. We applaud the FCC

1 for initiating the 706 Conference and for going out into  
2 America to hold regional hearings to examine both the  
3 successes of and barriers to the deployment of advanced  
4 services. We're anxious to share our stories with you.  
5 Again, welcome to Montana.

6 Others that will be making remarks when I'm done  
7 are Betsy Allen, a representative representing Senator  
8 Conrad Burns; Liz Chang, who represents Senator Max Baucus;  
9 and Char Helmick, who is representing Congressman Rick Hill.

10 With that, Commissioner Rowe.

11 COMMISSIONER ROWE: I'm going to move over to the  
12 projector. I want to start by first of all thanking Dave  
13 and Nancy and Gary for their support for this project and  
14 again acknowledging the work the staff has done. Bonnie  
15 Lorang has done, I think, some of the most creative work in  
16 this whole area really ever since the 1996 federal act  
17 passed, and I like to call her "Bonnie Accessee" for all of  
18 the things that she's done.

19 I also want to recognize the work that  
20 Representative Hill, Governor Racicot, Senator Baucus, and  
21 Senator Burns have all done in this area. You'll be hearing  
22 about that in just a few minutes. You'll also be hearing  
23 from Tony Herbert on behalf of the administration.

24 I do want to single out Senators Baucus and Burns.  
25 I've worked very closely with their offices, and we're

1 very, very lucky to have two senators who are as Internet  
2 savvy as are they and who have really done a tremendous  
3 amount. I'm sure you'll hear from Liz that Senator Baucus  
4 is convening an economic development summit this weekend  
5 that's just really taken on some enormous momentum, and he's  
6 been very active in all these areas.

7           Senator Burns is, I hope everyone here knows, is a  
8 member of the bipartisan forum team that made sure that when  
9 the act was passed, it was a balance of universal service  
10 and competition provisions. And, in fact, he was the  
11 godfather of Section 706, was working on these issues as the  
12 drafting went forward back in 1995, and I'm sure we'll hear  
13 more about each of their efforts. We're really very, very  
14 fortunate to have their support for this project and their  
15 vision in all these ways.

16           I also want to again welcome Nan from Alaska. We  
17 think of ourselves as rural and talk about there's urban,  
18 there's rural, and there's frontier, and then there's  
19 tundra. They had quite an adventure with the field hearing  
20 in Alaska just a couple of months ago. In fact, there was a  
21 little federal-state tension on the back of a snowmobile  
22 going out for one site visit, but that's a story for another  
23 time.

24           And my good friend, Jeff Richter, from the  
25 Wisconsin Commission staff, who has led the Internet

1 analysis within our national organization now for a number  
2 of years.

3 I'm going to put up a couple Power Point slides.  
4 Some of you have seen these, and I apologize. When  
5 customers complain to me about digital divide issues,  
6 they're talking about an awful lot of different things, and  
7 they're all right. The way I've tried to lay those out --  
8 again, some of you have seen this before -- is in terms of  
9 the network layers. Sometimes the concern is backbone,  
10 switch, loop. Sometimes it's the absence of the right kind  
11 of customer premise's equipment, whether it's a computer or  
12 Internet device. Sometimes it's the absence of applications  
13 that makes sense. Sometimes it's the absence of just the  
14 human capital and support.

15 And as to each of those issues, there are different  
16 problems. Is it the facilities don't exist? Is it they're  
17 exhausted or congested? Is it the price? Is it a quality  
18 issue, outages, or slow provisioning, can't get the T-1 when  
19 you need it, you can't get the technical support when you  
20 need it? All of these issues have been identified as  
21 digital divide type issues, and this is simply another way  
22 of looking at those.

23 Another way to look at it is in terms of density  
24 and demand; and if you live in a high-density, high-demand  
25 area, that's where the competition solutions are going to

1 take you the farthest, the market solutions.

2 Well, there are also high-density low-demand areas,  
3 and the first thing that the Joint Conference did in March  
4 was go to a low-income urban neighborhood in Washington,  
5 D.C. Well, there you may want to use economic development  
6 kinds of approaches to supplement the competition efforts.

7 Low density, high demand, we have some examples of  
8 that here in Montana. Customers want the service, but they  
9 may be in a remote, high-cost area. What are the solutions  
10 there? Are there new technologies? There are different  
11 views of whether there are technological fixes for that  
12 problem. Can you aggregate demand to push services further  
13 out? Is universal service a part of the solution there?

14 And then the low-density, low-demand area, where we  
15 really have to be creative and bring all of the strategies  
16 together.

17 What's been exciting in the Joint Conference  
18 process is that state and federal commissioners have gone  
19 out together to learn about the problems and learn about  
20 what's working, and the Telecommunications Act gives us at  
21 least four good sets of solutions:

22 The competition solutions under Sections 251 and  
23 252 that requires companies to interconnect and deal with  
24 wholesale level issues.

25 The universal service sections under 254. Montana

1 receives almost \$45M in total high-cost fund support,  
2 primarily to the smaller companies and a very small amount  
3 to U.S. West.

4 Or is it the Section 271 solutions that spell out  
5 the terms for a Bell operating company, such as U.S. West,  
6 to get into long distance? And in the western region,  
7 states are working together on, I think, a very innovative  
8 process to make the Section 271 requirements work for U.S.  
9 West and work for the competitors.

10 And then finally, the Hail Mary part of the  
11 Telecommunications Act is Section 706, where Congress,  
12 looking clearly years ahead of the time they were writing  
13 the act, said, "We want the FCC, we want the state  
14 commissions, to promote access to advanced services. We  
15 have our eye on something a lot bigger than plain old  
16 telephone service."

17 The Joint Conference was an attempt within this  
18 cooperative federalist structure to move that process  
19 forward, to be creative, to find out what the problems are,  
20 what the successes are, ask how we can support those  
21 successes going forward. Nan will tell you more about what  
22 they've learned.

23 There's a very lively, very good web page up. You  
24 can get to that through the FCC web page. You can get to it  
25 through the Montana web page. There's a survey in an effort

1 to collect data we encourage everybody here to participate  
2 in. The findings of this meeting and the meeting on Friday  
3 will be incorporated into that process. So this really is  
4 an opportunity to be creative, to aim high, and hopefully to  
5 achieve some very exciting things. Thank you. Nan.

6 COMMISSIONER THOMPSON: Thanks. I'm going to -- thank  
7 you for welcoming me here to Montana. I want to put this  
8 hearing -- this regional hearing in perspective for those of  
9 you that are participating here today and in Wyoming.

10 To put this regional hearing in perspective, this  
11 is the last of six regional hearings. The Joint Conference  
12 was appointed just last November by the FCC. There are five  
13 state commissioners and the five FCC commissioners, and  
14 together the ten of us have the mission of figuring out how  
15 it is we could ensure deployment of these advanced services  
16 nationwide, what could we do as regulators, as policymakers,  
17 to try and encourage folks in industry to make sure that  
18 everyone had -- could take advantage of what this technology  
19 could offer in terms of education, economic development, and  
20 lifestyle improvement in general.

21 We set about the task by doing two different  
22 things. One is these regional hearings, and this is the  
23 last of them. There were six. And the purpose of the  
24 hearing, again, is to listen and learn what folks are doing  
25 on a local level, to try and find creative success stories

1 and highlight them so that others could take advantage of  
2 that information. And also, to identify what the problems  
3 really were. To see if on a nationwide basis we could  
4 identify similarities that we as policymakers could do  
5 something to resolve.

6           The other part of the piece for us is data  
7 gathering, and Bob mentioned that we have -- it just went up  
8 recently. The National Regulatory Research Institute is  
9 compiling for us a data base, and there is a survey --  
10 again, accessible through our web site that you can get to  
11 through the FCC's web site, and we encourage everyone to  
12 participate. It won't take more than five or ten minutes.

13           And all that data is going to be put into a  
14 web-searchable data base so folks other places,  
15 policymakers, folks in industry, anywhere in the country, if  
16 they have a community of a particular size, certain  
17 technology parameters they're working with, they can go in  
18 there and research what folks in other places in the country  
19 have done to solve those problems. We're hoping that by  
20 spreading the information that folks like you have developed  
21 on a local level, making that available nationwide, we can  
22 encourage people to try and think about different creative  
23 solutions.

24           So I'm looking forward to hearing from the  
25 panelists we have here today. It looks like a distinguished

1 group, and the experience we've had at the other regional  
2 hearings this week is tremendous. To me, the different  
3 ideas people come up with, the way -- the human ability to  
4 creatively and constructively solve problems when folks are  
5 able to collaborate, has been -- has been inspiring. I hope  
6 to use the information we get today to share with others  
7 other places in the country.

8 MR. FISHER: Next we'll hear from Betsy Allen from  
9 Conrad Burns' office. Betsy.

10 MS. ALLEN: Thank you, Commissioners. I'd like to  
11 thank the Joint Conference for this opportunity to speak  
12 here today. Unfortunately, the Senator could not be here  
13 today. He's back in Washington doing what he does best,  
14 working for Montana, but he sends these words.

15 "Members of the 706 Joint Conference and interested  
16 parties:

17 "As author of the Section 706, crafted during the  
18 development of the 1996 Telecommunications Act, the topic of  
19 today's hearing is critical to the future of this country.  
20 The pace of deploying broadband technology to rural America  
21 is exceedingly gradual. Today's hearing is intended to  
22 convince the FCC to act upon its Section 706 authority  
23 rather than to continue to drag their feet.

24 "Commissioner Bob Rowe and the Joint Conference on  
25 Broadband Access has provided this opportunity both in

1 Montana and Wyoming for testimony from witnesses that will  
2 expound on success stories and identify those barriers to  
3 deployment.

4 "Broadband deployment to rural America must be  
5 accelerated for electronic commerce to meet its full  
6 potential. Access is as important to our small businesses  
7 in Montana as water is to agribusiness, and our state faces  
8 unique challenges due to its vast distances coupled with  
9 low-level economic development outlooks. In reports last  
10 year, a mere 2 percent of Americans had broadband access.  
11 The FCC is adhering to statements of broadband deployment  
12 across the nation and refusing to invoke Section 706  
13 authority. FCC inaction will not be allowed to dismantle  
14 Section 706.

15 "Montanans have not stood idly by and watched the  
16 "digital divide" grow. By pooling their limited resources,  
17 Montana's independent and cooperative telephone companies  
18 are doing great things. Consortiums such as MAIN,  
19 VisionNet, Skyland Technologies, and Montana's own  
20 Commissioner Bob Rowe are leading the way to conquer the  
21 challenges of telecommunications in rural Montana.

22 "In another step, aimed at increasing the  
23 availability of high-speed Internet access in rural America,  
24 I have introduced another bipartisan bill. Facilitating  
25 Access to Speedy Transmissions for Networks, E-Commerce and

1 Telecommunications or FASTNET. FASTNET is intended to  
2 relieve small telephone companies from some burdensome  
3 reports and accounting regulations. It would also compel  
4 the FCC to act promptly on small companies' requests for  
5 regulatory relief. It is my belief that federal regulations  
6 may be too burdensome for the large companies, but they're  
7 strangling the small companies.

8 "We have a lot of exciting things happening in  
9 Montana thanks to the Internet. Dot.coms are popping up at  
10 an exciting rate, and other folks are using the Internet to  
11 support their families. We need to make sure that the  
12 infrastructure in rural America keeps up with the pace.  
13 Thank you for all who are participating today. Just your  
14 presence is the signal to the FCC as to what Montana and  
15 rural America needs to shape our electronic commerce into  
16 the mold for success.

17 "Sincerely, Conrad Burns, United States Senator."  
18 Thank you.

19 MR. FISHER: Thank you, Betsy. Next we'll hear from  
20 Liz Chang, from Senator Baucus' office.

21 MS. CHANG: Thank you for having -- inviting Senator  
22 Baucus to this hearing. I know that he would have loved to  
23 have been here because it's an issue near and dear to his  
24 heart; and it's so good to see some people we've worked with  
25 closely, actually, in the very near past. I see Lynn

1 Churchill, Colonel Mike McCabe, Mike Strand, John Zauher,  
2 Larry Wetsit, and the rest of you who are so vital to  
3 Montana's venture into the digital age.

4 Let me read a statement for him that Senator Baucus  
5 wanted to make sure was available.

6 "Good afternoon. I'd like to thank you, Dave, and  
7 the FCC for putting together this forum and inviting me to  
8 participate.

9 "I very much appreciate the FCC's efforts to put  
10 together a national clearinghouse of broadband deployment  
11 projects and best practices by communities across the nation  
12 that build upon lessons learned by others.

13 "From a public policy perspective, Congress's goals  
14 are to ensure that broadband deployment is timely, that  
15 industry competes fairly, and that service is provided to  
16 all sectors and geographical locations of the United States.

17 "We have our own experts here today who will  
18 articulate Montana's existing structure and a vision for our  
19 future capability. I applaud their tenacity and dedication  
20 to this important responsibility. This is a charge that  
21 involves us all: individuals, businesses, health,  
22 education, utilities, agriculture, tribes, and government.  
23 It is in our best interest as a state to come to grips with  
24 how we will address this digital divide.

25 "From June 25 through 26, our state will

Heritage Reporting Corporation  
(202) 628-4888

1 participate in the Montana Economic Development Summit in  
2 Great Falls. It is a gathering of Montanans representing  
3 different economic sectors who have pledged to work  
4 cooperatively and collaboratively in addressing the factors  
5 that hold our state's economy in check.

6 "Each of us must ask ourselves, What can I do to  
7 move our state forward? I am keenly interested in the  
8 Administration's and congressional initiatives that fund  
9 broadband development: loan guarantees, low-interest loans,  
10 and investment tax credits for broadband deployment.  
11 Additionally, increasing access, easing regulatory  
12 restrictions, and research and standards development are  
13 among my priorities.

14 "But we must move in quickly to harness the energy  
15 of this new economy. We have the will, we have the  
16 knowledge, and we have the desire. I look forward to your  
17 input and working with all of you to make this happen."  
18 Thank you.

19 MR. FISHER: Thank you, Liz. Before we go on -- I  
20 was asked by the court reporter and forgot to do so -- as we  
21 go through this hearing, if we could speak slowly and  
22 clearly and only one at a time, she would appreciate it.  
23 I'm sorry I forgot to mention that.

24 Next we'll here from Shar Helmick representing  
25 Congressman Hill. Is Shar here?

1 MS. HELMICK: Well, I don't know who else came from  
2 Helena today, but I wasn't sure I was going to make it. In  
3 time anyway. Congressman Hill also is in session today and  
4 would like to be here, but sends his regrets.

5 "Dear Friends: Thank you for inviting me to join  
6 you for this FCC-State 706 Joint Conference on Advanced  
7 Telecommunications Services. Unfortunately, due to the  
8 congressional schedule, I am unable to be with you today,  
9 but I'd like to share a few thoughts with you as you gather  
10 for this important conference.

11 "Technology is changing the world around us. From  
12 private business to government, from shopping to  
13 entertainment, from research to education, technological  
14 advancements have changed the way we communicate on every  
15 level. In rural America we must focus on improving our  
16 telecommunications capabilities in order to make sure that  
17 everyone will have the same opportunities to take advantage  
18 of all that technology has to offer.

19 "As Montana's representative, I'd like to express  
20 my appreciation to Montana's Public Service Commission and  
21 the Federal Communications Commission for providing this  
22 opportunity to bring together regional, state, and local  
23 representatives for a productive dialogue about the future  
24 of telecommunications. I hope that all the participants  
25 will benefit from the information that will be exchanged

1 during this hearing and that the contacts you make this week  
2 will have a positive impact on Montana's future.

3 "Thank you again for inviting me to attend this  
4 important event. Best wishes for a successful and  
5 informative conference.

6 "Sincerely, Rick Hill, Representative for all  
7 Montana."

8 MR. FISHER: Thank you, Shar. Before we get into our  
9 panel discussions, we need to break for about three, four,  
10 five minutes to get ready for that, so we'll be on break.

11 (Off the record.)

12 MR. FISHER: The first panel discussion, The Efforts  
13 and Challenges of Advanced Service Deployment, will be  
14 facilitated by Commissioner Bob Rowe.

15 COMMISSIONER ROWE: We're passing the microphone around  
16 for purposes of the transmission. What I'm going to do is,  
17 speaking slowly, introduce each of the panelists. They will  
18 give an introductory statement. Several of them, I know,  
19 will have Power Point presentations.

20 We'll have some follow-up questions and discussion  
21 up here, and then we'll move to discussion from  
22 participants, starting with questions from those here at  
23 Montana State, and then going sequentially to Billings, to  
24 Glasgow, to Pablo, and Cheyenne, Wyoming, and we'll work  
25 through in that order, and we'll spend about 45 minutes on

1 this.

2           We really do have a great panel to kick things off.  
3 Our first speaker will be Tony Herbert, who is the minister  
4 plenipotentiary for Governor Racicot on all things  
5 technological. He's the administrator of the Department of  
6 Administration. He's head of the Information Services  
7 Division, ISD to those of us who are state employees, and is  
8 responsible for the direction of information technology for  
9 the entire state. And ISD provides the operation of the  
10 state-wide voice, data, and video networks and management of  
11 the state central computing facilities.

12           Following Tony be Dr. Lynn Churchill of the  
13 University of Montana, so I guess we can say "Go Grizz"  
14 despite the hostile location here. Dr. Churchill is  
15 Director of the Information Technology Resource Center, or  
16 the ITRC, at the University of Montana; and the ITRC is an  
17 advanced technology, research, development, and training  
18 center which is recognized nationally and internationally  
19 for its projects using innovative technologies in both the  
20 public and the private sectors. He's also the principal  
21 investigator for the University of Montana's Internet2  
22 initiative, and he's a research associate professor in the  
23 Department of Mathematical Sciences.

24           And batting cleanup is Colonel Michael, or "Mike,"  
25 McCabe, and Colonel McCabe is a native Montanan who has

1 worked full-time for the Montana Army National Guard since  
2 1984. Prior to his full-time involvement with the Guard, he  
3 was a practicing trial attorney and who probably has had  
4 greater trials in the last few years than ever in private  
5 practice.

6 He's held a number of positions in the Montana Army  
7 National Guard, including Chief of Staff, staff attorney,  
8 assistant personnel officer, and labor relations officer.  
9 In August of '99, he became the project officer for the  
10 Montana Army National Guard's Distance Learning Project.

11 This is a very exciting project, probably not  
12 something he thought he was enlisting for in 1984, but we're  
13 glad he's doing it now. And the project is going to commit  
14 nearly \$5M, \$4.5M, to establish an ATM-based network that  
15 connects 22 armories around the state carrying voice, video,  
16 and data. It will also be something of a community service.  
17 Colonel McCabe is going to be describing that exciting  
18 project as well.

19 So starting off with Tony Herbert. Tony, to what  
20 extent does state government in Montana now provide voice,  
21 data, and video networks? How have the networks evolved to  
22 where they are today? And I guess the obvious question  
23 there is, Where are they going?

24 MR. HERBERT: I have to say I think this is the  
25 first time I've been given five minutes to speak and then

1 told to speak slowly.

2 Thank you, Mr. Chairman and members of the  
3 Commission. It's my pleasure to address you today. As the  
4 fourth largest state in the country with the sixth smallest  
5 population, Montana has unique challenges in the deployment  
6 of advanced telecommunications services to its citizens. I  
7 would like to take the brief time I have with you today to  
8 discuss Montana's telecommunications services within state  
9 government. Very importantly, I want to discuss a new  
10 contract we have just signed with U.S. West to provide ATM  
11 services to ten Montana communities.

12 The Information Services Division is responsible  
13 for the management of voice, data, and video services for  
14 all agencies of state government and the university system.  
15 By statute ISD can also provide services for political  
16 subdivisions of the state and for certain nonprofit  
17 organizations.

18 State government is the single largest user of  
19 telecommunications services in the state. Today we have  
20 approximately 22,000 phones, over 10,000 PCs, 17 video  
21 systems, over 550 router locations, and we have services in  
22 all counties and in 130 communities.

23 We have three major network services, which are  
24 entirely provided to us by the industry with minor  
25 exceptions. We acquire these services through competitive

1 bidding or through direct purchases from tariffs, where  
2 applicable.

3           Our current voice network came into being in 1987,  
4 when we digitized our intercity services, and it terminates  
5 in 13 Montana cities. Initially, the leg crossing the LATA  
6 between Helena and Bozeman was provided through a  
7 state-owned microwave system. This microwave system saved  
8 us significant dollars versus leasing at that time. That  
9 leg of the network has since been retired and is now  
10 provided by AT&T and by Touch America.

11           The Montana Educational Telecommunications Network,  
12 or METNET, came into being in 1989, as we implemented T-1  
13 compressed video into the cities noted on the map.  
14 Predominately located at university campuses, the network  
15 provides distance learning to university students, but is  
16 also used by state agencies to conduct business conferences.  
17 This network can also interconnect with five other distance  
18 learning and telemedicine networks in Montana, and we can  
19 connect with interstate locations through AT&T and U.S.  
20 Sprint.

21           Summitnet, the State and Universities of Montana  
22 Integrated Network, is the state's data communication  
23 network, and it came into being in 1995. It provides TCP/IP  
24 connections for state and university personnel in all 56  
25 counties of the state and in 130 communities. U.S. West

1 provides frame relay services to 11 Montana communities, and  
2 our rural cooperatives provide backhaul circuits to our more  
3 distant towns.

4           We have just signed a contract with U.S. West for  
5 the deployment of ATM technology in Montana. This project,  
6 which has become known as Summitnet II, officially began  
7 last fall and has just culminated last week in a contract to  
8 deploy advanced services into Montana's largest communities.  
9 The goal of the project has been to support the growing  
10 needs of agencies and the university system, consolidate  
11 existing networks, encourage new investments, encourage  
12 cooperation among industry members, and lower or maintain  
13 current costs.

14           Our contract has been based upon the anchor tenancy  
15 concept, through which the aggregation of public needs  
16 drives investments in new technology by the industry.  
17 Through this effort, ATM technology will be available in  
18 nine new communities. This includes our larger cities of  
19 Billings, Bozeman, Missoula, Great Falls, and Butte. And I  
20 emphasize "larger" on the Montana scale. But also  
21 communities as small as Havre, Kalispell, Miles City, and  
22 Dillon. For the Commission's information, Miles City is a  
23 community of only 8,400 people, and Dillon boasts a  
24 population of only 4,000.

25           The map that you see here depicts the resulting

Heritage Reporting Corporation  
(202) 628-4888

1 infrastructure that will be in place upon the completion of  
2 the network. I know it's very difficult to read there, but  
3 there are handouts. Please note that this network has  
4 portals to the Internet which are used by all users.

5           Quickly, the project has generally and specifically  
6 met the overall project goals, provides for the  
7 consolidation of networks, prepares us for the growth we  
8 anticipate in the future, and is doing so at a cost which  
9 approximates our current costs.

10           Perhaps the greatest benefit of this new contract  
11 is the deployment of advanced services into many Montana  
12 communities which would otherwise not see these services for  
13 several years to come. These communities are small on a  
14 national scale, but as the anchor tenant, the state has  
15 provided the incentive to help these new investments take  
16 place. As an example, the ATM switches are the  
17 technological platform from which other services like  
18 Digital Subscriber Lines services and LAN switching services  
19 can be operated. We are very excited about the economic  
20 development prospects this new environment represents to our  
21 state.

22           To quickly address barriers, I would just point out  
23 to you that mileage-sensitive pricing is problematic for a  
24 great state like Montana. If further penetration of  
25 advanced services into very rural areas is desirable, then

Heritage Reporting Corporation  
(202) 628-4888

1 subsidies or incentives of some kind I believe are going to  
2 be necessary. That concludes my remarks. Thank you.

3 COMMISSIONER ROWE: Thank you. Dr. Churchill, what are  
4 the common issues in education, business, and other areas  
5 concerning telecommunications, and particularly the  
6 effective use of advanced technology in Montana?

7 DR. CHURCHILL: Thank you, Mr. Commissioner. I think  
8 one of the key issues that we'll see in this presentation is  
9 that the issues you brought up earlier are the same ones  
10 that we're finding with respect to both business and  
11 education. I'll wait two seconds here while he brings up  
12 the Power Point.

13 (Off the record.)

14 DR. CHURCHILL: One of the first aspects that  
15 Commissioner Rowe brought out earlier is the aspect, and one  
16 of the issues in Montana we deal with and have for some  
17 time, is the issue of infrastructure. Another issue has to  
18 deal from the standpoint of technical support, the people  
19 necessary to keep the infrastructure running and  
20 operational.

21 Another aspect is training, professional  
22 development, how we grow people to run those systems and to  
23 use those systems. And the way that we justify having those  
24 systems is to have content and applications that can utilize  
25 those and pay for their existence.

1           Next we have the issue of funding, which is one of  
2 the issues that we all fight within Montana from the  
3 standpoint, you know, what it's going to cost and what it  
4 may take to try and accomplish that task. And last but not  
5 least is the issue of policy.

6           This map -- and I understand -- I was expecting  
7 there to be a little larger picture. There is a -- this  
8 actually came from a set of maps at the Natural Resource  
9 Information Systems Montana map section in the state  
10 library. It is online if you want to go out there and look  
11 for it.

12           What I want you to notice is that we have certain  
13 pockets of -- places within the state in terms of large  
14 population centers. "Large" means somewhere between 10,000  
15 and 100,000, are large pockets; and from that standpoint,  
16 there's about 12 cities or towns, I believe, that are above  
17 10,000. There's over 400 communities though; and in that  
18 sense, if we start to look at the issue of communications,  
19 we have to be aware of the distribution of people across  
20 Montana and the challenges that they face in very small  
21 communities, especially when businesses have to justify  
22 implementation of an infrastructure and pay for it with  
23 those services.

24           Another aspect we have to look at is from the  
25 standpoint of wages in Montana. The last report that I had

1 is that Montana is 50th in the nation in terms of IT wages.  
2 So from the standpoint of looking at average IT wages, we're  
3 50th in the nation. And as many of you know, we rank  
4 extremely low, we're 46th in the nation, in terms of average  
5 income. So from the standpoint of people being able to pay  
6 large amounts of money for advanced services, that's an  
7 issue we have to address as well.

8           We also have to look at it from the standpoint of  
9 moving populations. This is actually a representation of  
10 what's happening with respect to Montana's economy. We're  
11 finding out that very rural areas are losing populations  
12 very quickly.

13           The infrastructure challenges that I've observed  
14 were from both education and business and involve aspects of  
15 local loop. Looking at the issue of how we keep track of  
16 data traffic in Montana is another important part. So the  
17 issue of looking at how we're going to interconnect the  
18 various carriers is another issue.

19           And last but not least is the issue of looking at  
20 overall Internet access and what it takes for us to backhaul  
21 to places like Seattle and Denver.

22           With respect to local loop, we do have a lot of  
23 things going on, and there's been a tremendous amount of  
24 progress made by both rural telcos as well as U.S. West in  
25 terms of distribution and dissemination of DSL. We also

1 have things like LMDS, which is the wireless kind of  
2 communication that's being deployed as well; but, again,  
3 primarily within the major population centers. And last but  
4 not least we also see cable-based Ethernet kind of access  
5 growing in the larger population centers.

6           The local loop issues, though, are important  
7 because the equitable availability of broadband to extremely  
8 small communities or anyone living outside of five miles  
9 from a town is a major issue. And also from the standpoint  
10 of looking at the key components of equitable cost of  
11 broadband is another issue from the standpoint that if you  
12 are in a very small, rural town, the cost is usually quite  
13 high.

14           The issue of interconnects is one in which there's  
15 been some tremendous efforts going on in Billings in a --  
16 nearly an operational connector soon from the standpoint of  
17 interconnecting the major carriers within Montana and  
18 Billings. There is as well another plan that's in place --  
19 actually, a couple of plans that have to deal with one being  
20 created in Helena, another one in Missoula.

21           The interstate and Internet access from the  
22 standpoint of high-speed interstate connections to the major  
23 Internet points in Seattle, Denver, Minneapolis, and Calgary  
24 are the major options that we have to basically get online.  
25 The backhaul comes at a significant cost to Montana

1 citizens, businesses, and education. And last but not  
2 least, it's always a factor in discussions with potential  
3 technology-based corporations looking to come to Montana.

4 I want to share with you as the PI to the Internet2  
5 project where the major Internet2 GigaPoPs currently reside.  
6 This is the June 2000 map. You'll notice a hole somewhere,  
7 right? Also, since Internet2 tends to rely on the Qwest  
8 backbone -- if you'll bring that up next. You'll notice  
9 another hole out there from the standpoint of the high-speed  
10 backbone for the Internet2 traffic.

11 What Montana needs to be competitive is to make a  
12 connection, is to multihome the state to Seattle, Denver,  
13 Minneapolis, and possibly Calgary. The major technical  
14 support areas we have to look at are basically listed there,  
15 and I can go very quickly through this, since we are  
16 speaking slower and not moving quite as fast; and what we  
17 basically have there is covering the range of everything  
18 from wiring to looking at programming to looking at  
19 everything from digital media, etc.

20 The most common delivery vehicles that we use out  
21 there as well from the standpoint of looking at training,  
22 professional development, we have developed professional  
23 development out there in order to meet the needs everyone  
24 else is facing in other advanced technology corporations.  
25 We as well have to meet the need from the standpoint of

1 justifying that we have a high-skilled labor force if we  
2 can't bring companies here.

3           The most common modalities for delivery are  
4 on-site, remote-site delivery, and online delivery, and  
5 these vehicles are extremely important from the standpoint  
6 of looking at a diverse way of delivering training and  
7 instruction across Montana.

8           The content and applications that we're looking  
9 for, we have a number of courses and programs currently  
10 being offered from MSU, U of M, and others, that I think it  
11 needs to be acknowledged that Montana is doing a  
12 considerable amount in that regard.

13           Research data streams, though, can push this, as  
14 well as streaming technologies. When we look at NASA data  
15 streams of 8 terabytes a day to be processed, it begins to  
16 paint a different picture from the standpoint of what we  
17 need for Montana.

18           Funding is an issue as well, and in that area we  
19 have to acknowledge the FCC, and the work they've done with  
20 E-rate has been a tremendous benefit to Montana's K-12  
21 schools, and we are appreciative of that effort.

22           In other areas as well, we have to look at what's  
23 going to drive E-Commerce and what's going to happen from  
24 the standpoint of IP-based video, etc. Quality of service  
25 is an issue.

1           And last but not least is policy from the  
2 standpoint of looking at the kinds of things that we need to  
3 look at. Many of these areas -- we'll just go ahead and go  
4 through there -- are primarily issues from the standpoint of  
5 equity of access, equitable cost for services, looking at  
6 issues of educational pricing, especially if we have  
7 commodity pricing for bandwidth. It will basically be very  
8 difficult for education to meet those demands. He said  
9 stop. I'll stop.

10           COMMISSIONER ROWE: Our panel is doing a good job of  
11 setting an example of speaking at 56 kilobytes, where I was  
12 trying to use load voice compression.

13           Colonel McCabe, you learned an awful lot about  
14 telecommunications since becoming the project officer for  
15 the Distance Learning Project last year. Could you describe  
16 the project, and what have you learned most from it?

17           COLONEL MCCABE: Thank you very much for the  
18 opportunity, Bob. The first thing I'd start out by saying  
19 is the first thing we learned about kilobytes is they're not  
20 free, and that in Montana, when you buy kilobytes, if you're  
21 using frame relay, you pay for a full T-1 circuit, but you  
22 only get 56 kilobytes. For us in the Montana Guard, as we  
23 looked at what that was going to do for us in trying to  
24 train our soldiers, we immediately determined that the first  
25 thing we needed to look at was technology to solve the

1 problem.

2           The next lesson we learned is everybody has an  
3 expert and everybody's expert is right, and they're not  
4 going to change, and especially when you talk about  
5 equipment providers. They've got the piece of equipment  
6 that can do it and work, and they're happy to sell it to  
7 you, but we actually went out and got an independent who  
8 doesn't sell any equipment to give us a review of what  
9 equipment was involved and came up with the ATM network.

10           That's important -- if you go to the slide show, go  
11 to the next slide. As you look at the size of Montana --  
12 and you're going to get tired of seeing this about Montana,  
13 but not half as tired as you are if you try to conduct  
14 training to 22 armories around the state of Montana and have  
15 to put in the windshield time. To go from Libby, Montana  
16 which -- the next slide -- is in the upper left-hand corner  
17 to Sidney, Montana, where we have another unit, could take  
18 you ten and a half hours, assuming that the weather was good  
19 and the traffic was good and, unlike this year, there wasn't  
20 any road construction. It's just a horrendous drive.

21           To conduct training in that environment, what that  
22 means for us is that we customarily have to put people on  
23 the road for anywhere from four to six months during the IDT  
24 or weekend drill periods, which we only have 48 four-hour  
25 sessions during the year to train our soldiers.

1           We are a low-density state of 4,000 soldiers and  
2   air personnel, but we're a high-density demand when it comes  
3   to the situation of the training we're required to provide.  
4   The technological proficiency required of our military  
5   members right now has become overwhelming. The amount of  
6   education they want us to have has become astounding,  
7   especially for officers.

8           There's two parts to it: traveling to go get the  
9   training to them; the second part is traveling -- the  
10  soldiers' travel to get the required training at other  
11  locations. Anybody who's flown into Montana knows what that  
12  cost is. The average cost for one of our soldiers to go to  
13  a school is \$2,000.

14          The next slide. That shows a larger population  
15  area, which we could deal with and would be relatively easy  
16  to deal with if those were the only units that we had to  
17  deal with. Communication in that area is fairly good. The  
18  price structure is fairly good as well in terms of the  
19  services provided.

20          The next slide. As you look at the slides of our  
21  16 remaining armories, you realize the amount of miles and  
22  distances involved. It's overwhelming. The price is  
23  astounding when you talk about communication. I will tell  
24  you, in my experience there are two words that make me  
25  extremely tired. One is "backhaul," and the other is

1 "mileage," because every time you hear them, the next thing  
2 is, "Yeah, how much is it going to cost?"

3 And to give you an example, Libby, Montana, for a  
4 T-1 circuit to our armory is \$3,500 a month; and we have to  
5 go out through Idaho and back into Montana through Bonner's  
6 Ferry to get that connection because there isn't any surface  
7 communications or wire communications within 50 miles of  
8 Libby. On the eastern side of the state, we have some areas  
9 where it's \$2,500 a pop as well, so it's expensive. That's  
10 why we looked at going with telecommunications.

11 The next slide, the LATA. The LATA makes no sense  
12 to us as a customer. I'm being very honest. The only thing  
13 that we can see that it does is increase cost. And as we  
14 started our system, it was an ATM system, it was going to be  
15 private because ATM capability wasn't offered through public  
16 circuits at that time. As we looked at that, that LATA  
17 increased our costs by \$1M in equipment that we would have  
18 had to cross that LATA. We do have some security  
19 requirements that are unique. They do pose some  
20 difficulties when you talk about the concept of aggregated  
21 ATM in some of the other areas of the state.

22 The next slide. The 18 independent  
23 telecommunications providers in Montana that show up on that  
24 map have to be applauded for what they've done. We have  
25 learned how hard it is for them to do their jobs because

1 they have patiently put up with us asking questions: Can  
2 you do this? Can't you do this? How can we accomplish this  
3 into getting to our various armories? I have to applaud  
4 them. They are fantastic. U.S. West has been  
5 extraordinarily good to us as well and patient. But cost is  
6 a real driving factor.

7           Next slide. I only have one minute. It goes real  
8 fast, doesn't it? The VTC sites, there are plenty of VTC  
9 sites in the state of Montana. The difficulty is  
10 communicating with each other. There is not a  
11 standards-based VTC network, there is nobody that provides  
12 the scheduling for the entire state, and there is nobody  
13 that provides bridging capability. One of the capacities  
14 we're bringing to the state with our network is that we will  
15 have the ability to bridge with every network in the state  
16 of Montana in order to provide communications if necessary.

17           The next slide is just a summary of where our  
18 armories are located and where we're going to ultimately  
19 have locations. Three communities are involved in share  
20 usage, which means they're footing the bill for this as  
21 well. That's Miles City, Libby, and Flathead Community  
22 College in Kalispell. We're proud of that effort. We  
23 really believe that as you look at the situation in Montana,  
24 as you talk about distance learning, you really have to  
25 consider subsidies and some programs such as the recently --

1 recent bill introduced into Congress that talks about  
2 subsidies for the rate structure out here because we don't  
3 have the population to support it any other way. Thank you.

4 COMMISSIONER ROWE: Thank you all very much. You heard  
5 a lot in this panel, both about the tremendous challenges  
6 and about some exciting things that are happening. Are  
7 there questions first here at MSU?

8 COMMISSIONER THOMPSON: I have some if -- do I need the  
9 mike to ask them or can I speak loudly enough?

10 COMMISSIONER ROWE: Probably so these folks can hear  
11 you, unless they can read lips.

12 COMMISSIONER THOMPSON: This is really a question for  
13 each of you to answer, perhaps, in turn; but what do you see  
14 as the most significant regulatory barrier to doing the type  
15 of deployment that you've been trying to do? What can we as  
16 policymakers seek to change to make your jobs easier?

17 MR. HERBERT: The most significant regulatory barriers.  
18 I think that the need for continuing to encourage  
19 competition is really important wherever we go because I  
20 think that's how ultimately we're going to get to the kinds  
21 of -- a lot of services that we want. However, I think you  
22 have to consider and continue to work on incentives of some  
23 kind for companies to go to the very rural parts in places  
24 like Montana.

25 I mean, we're able to do some things possibly

1 through aggregation, "we" being state government, and see  
2 some services show up in our larger communities; but I think  
3 it's extremely difficult when we talk about the costs  
4 associated to the services that we're talking about to get  
5 to these very rural areas.

6 I think programs like the E-rate, incentives, tax  
7 incentives. Montana has provided a recent bill out of their  
8 session last year for I think it was a \$2M rebate program  
9 for investments in advanced services by companies, and I  
10 think those sorts of things need to be there or I don't  
11 believe companies are going to easily be able to do their  
12 best.

13 So I think you have to have that balance. You have  
14 to continue to support competition, but it's a two-way  
15 street, and it's going to be like that I think for a while.  
16 Very rural areas are what we're after.

17 DR. CHURCHILL: I think I'd have to say that, first  
18 of all, I'm very much concerned in terms of cost of services  
19 for education. I suspect it will end up in a commodity  
20 traffic model for pricing, and we need to be able to make  
21 exceptions for education because if we're going to be  
22 involved in K through adult education and receiving what  
23 they should from the standpoint of understanding this world  
24 and the rapidity at which it changes, it's going to be very  
25 much media based; and for education to try to foot the bill

1 from the standpoint of meeting that need, I don't think it's  
2 going to be feasible.

3 COMMISSIONER ROWE: What's the significance of a  
4 commodity model as opposed to the model that's currently  
5 used?

6 DR. CHURCHILL: Well, basically, the current needs will  
7 be priced according to a fixed capacity. So, for instance,  
8 for 56k, T-1, or DS3, those kinds of capacities say that you  
9 have this amount of bandwidth for this period of time per  
10 month, and you can put as much traffic over that as you want  
11 up to that capacity. So if you were able to fill a T-1 at  
12 1.54 megabyte, that you would be able to deliver that for  
13 the entire month at the cost of your T-1, if you had full  
14 capacity.

15 The problem is that I don't think we're going to  
16 stay there. I think the movement right now that we're  
17 seeing is a trend towards what we call commodity pricing,  
18 where you pay per megabyte of traffic going across a  
19 circuit; and when you do that, you are beginning to look at  
20 the whole issue of delivery of media and the potential  
21 impact on the end user. So I'm not necessarily against that  
22 model, and I see it actually happening right now. Those  
23 pricing models are currently happening to people that are  
24 delivering streamed media for both storage and delivery.

25 So as we look at that, what we have to say is that

1 if that's the model, that if we don't have educational price  
2 breaks and policy to help with research and education, I  
3 don't believe we're going to be able to afford it.

4 COLONEL MCCABE: I'm really not going to offer an  
5 opinion on that. I've talked a little bit about the LATA,  
6 but I'm primarily an implementor who has just faced the  
7 issues. I don't care why they exist; but if there's  
8 regulations that interfere or can't be understood or become  
9 too complex that you need a lawyer to explain them to you,  
10 all they're going to do is add costs to the end users, and  
11 those have to be considered for elimination.

12 COMMISSIONER ROWE: Other questions from here in the  
13 audience in Bozeman? Questions?

14 (No response.)

15 COMMISSIONER ROWE: Are there any questions in  
16 Billings? Let's go to Billings first.

17 (No response.)

18 COMMISSIONER ROWE: Nothing in Billings. Glasgow?  
19 Pardon me. Billings, any questions in Billings?

20 (No response.)

21 COMMISSIONER ROWE: Glasgow, any questions?

22 AUDIENCE: We have a question in Billings.

23 MR. HERBERT: She said she didn't.

24 COMMISSIONER ROWE: She said she didn't have any  
25 questions. Any questions in Glasgow?

1 (No response.)

2 COMMISSIONER ROWE: Pablo?

3 PABLO: No questions.

4 COMMISSIONER ROWE: And Cheyenne? In Cheyenne, any  
5 questions in Cheyenne?

6 CHEYENNE: No questions in Cheyenne right now. Bob,  
7 this is Steve from Cheyenne, and we are having some  
8 difficulty hearing you. You really need to get the  
9 microphone close to the speakers.

10 COMMISSIONER ROWE: We're giving you some more volume.

11 (Off the record.)

12 COMMISSIONER ROWE: What's the best way for government  
13 either to assent or to participate in deployment; and again,  
14 particularly in rural areas? If there were some examples  
15 each of you provided, you might want to come back to them.

16 MR. HERBERT: Well, you know, my answer is -- and the  
17 anchor tenancy concept that I spoke about earlier, or the  
18 Summitnet II project, is a good example -- I think  
19 government should look at itself as trying to be an anchor  
20 tenant for new technologies and to help get those into rural  
21 locations. I mean, as the largest user, that's a good place  
22 for it to go. It has to be able to aggregate traffic,  
23 though, in order to do that, and the more traffic it  
24 aggregates the better that ability really will be.

25 I think government also needs to encourage

1 cooperation among companies. I think that we -- we in  
2 Montana -- and this is true, I'm sure, in other states -- we  
3 have some areas where we can improve in that regard,  
4 regarding our rural communities and our -- our RBOCs, and  
5 the more they work together to provide common kinds of  
6 services the better in the end services show up for  
7 citizens. So I think there are things the regulatory side  
8 of the house can do. Maybe that's one of the things that  
9 you can also be looking at.

10 DR. CHURCHILL: I think one of the areas that as well  
11 to be looked at -- and Tony brought up a good point, and  
12 that is the fact that Summitnet II is actually a  
13 public-private partnership. But one of the things we've  
14 been confronted with over the years is the co-investment in  
15 a lot of activities where we mix both public and private  
16 funds; and in that way, if we were looking at trying to  
17 aggregate traffic of both public and private traffic  
18 together to build circuits, to build facilities together as  
19 a co-investment, I believe that we may have to loosen some  
20 of the restrictions in that regard in order for small  
21 populations across large geographic regions to be able to  
22 accomplish what it is they need to do to provide equitable  
23 service and access.

24 COLONEL MCCABE: From my experience over the last year,  
25 what I would really tell you is that we need to work on

1 improving the communications and get away from what I call  
2 the territoriality concept. There ought to be as many  
3 incentives as possible to say that anytime we deal with each  
4 other, we ought to look for how we can cooperate, and I  
5 think that's what Dr. Churchill was saying as well and Tony.  
6 Cooperate so when we spend a dollar, it's benefitting as  
7 many people and as many organizations as possible.

8           How do you do that? I think you really -- it's  
9 going to take principally state government to continue to  
10 develop the rapport and some form of an open forum where  
11 somebody such an outsider coming into the state can go to  
12 that forum and say, "Hey, this is what we'd like to do. How  
13 can we achieve this?" And then through a cooperative  
14 effort, we can come up with an answer that won't intimidate  
15 a potential investor in Montana to say, "Too many hurdles.  
16 Not enough technology." You get the bad public graft, and  
17 then after a while they stop coming to talk to you at all.

18           COMMISSIONER ROWE: If there are questions from the  
19 audience, if you could put a hand up, I'll be sure to  
20 recognize you.

21           Colonel McCabe, you've become a telecommunications  
22 expert. You're also -- you're now wearing an economic and  
23 community development hat as well. That's a new role,  
24 working with people in Libby or Miles City, for example.  
25 How does that work out?

1 COLONEL MCCABE: It's been really difficult, and it's  
2 been an eye-opening experience for me, and what I would  
3 really have to tell you is that I believe that government  
4 and any agency related to communications needs to get down  
5 to the communities. Educate them on what the capabilities  
6 are, educate them on rate structures, talk about the  
7 opportunities that are available. Certainly encourage them  
8 to look at becoming proficient in writing grants.

9 And then I really think that we need to come up  
10 with what I would call an economic business model for  
11 communications in communities so that they can look at it  
12 and say, "If we're going to have a shared use classroom or a  
13 distance learning classroom in this community, it's going to  
14 cost us this amount. And then what is it we want in terms  
15 of an audience to hear and what sort of a need do we have to  
16 provide and what sort of resources do we have that could go  
17 into that?" So that your content goes where it needs to go  
18 in the volume that it needs to do, and then increases the  
19 interest for the use.

20 You know, when we started with TVs, nobody wanted  
21 to watch TVs because there wasn't any content. Well, after  
22 a few people got TVs and started watching it -- I grew up  
23 watching the Chicago Black Hawks, you know, on TV because we  
24 got WGN. Guess what, pretty soon there were more TVs; and  
25 after a while, the content improved.

1           The same thing is true of our rural communities.  
2 They need to have the help and planning out there so that  
3 they can come up with an effort and the community  
4 involvement. It can't be done simply stepping in from the  
5 outside because I'll tell you what, even as the Guard is a  
6 member of so many communities, when you come in and say, "We  
7 have money. We'd like to do this." they still look at you  
8 and say, "Yeah, right. What's the catch?" They need to  
9 understand what the catches are and develop a plan.

10          COMMISSIONER THOMPSON: Dr. Churchill, I was intrigued  
11 by your map with a hole in it where Montana is, and I'm  
12 wondering what interest you think will need to be aligned,  
13 how is that problem going to get solved for Montana? How do  
14 you get a GigaPop?

15          COMMISSIONER ROWE: Is it pronounced "GigaPop" or  
16 "GigaPop"?

17          DR. CHURCHILL: It depends on where you're from. I  
18 think, actually, that to solve that problem it's a  
19 public-private partnership as well as an interagency  
20 solution. I would believe it would probably take something  
21 from the standpoint of looking at not only putting the pipe  
22 in place, which could come through a National Science  
23 Foundation initiative, from the standpoint of getting the  
24 necessary funding in place to accomplish that task, but then  
25 you also have to look at, Who are the potential carriers and

1 participants on the private sector side that can also  
2 facilitate that process? That might be something from the  
3 standpoint of looking, like, at Qwest and the relationship  
4 that I understand is growing with Touch America since they  
5 have the pipes that are big enough to solve that problem.

6           We as well would look at the issue of making it a  
7 comprehensive solution. A big pipe without having people  
8 that can run it is another issue. So I would hope that we  
9 aren't shortsighted, that we look at this as possibly being  
10 a Department of Labor, the H1B kinds of issues and funding  
11 there; that we might look at it from the standpoint of the  
12 Department of Education in both K-12, university, and adult  
13 learning; that we might look at investment from the labor  
14 unions for retraining.

15           I think if we look at it from the standpoint of  
16 meeting the needs, of solving the infrastructure problem,  
17 taking care of the issue of how you're going to run it and  
18 manage it, the technical support standpoint, making sure  
19 that you get people ready to be able to use it through  
20 appropriate training, and look at those applications of the  
21 NASA funding projects or the Department of Energy or other  
22 kinds of stuff that will justify its existence.

23           So I think if we look at this as an interagency  
24 strategic plan by both federal and state and private  
25 sectors, then I think that we have a chance of getting it

1 done.

2 COMMISSIONER ROWE: Questions from the audience?

3 (No response.)

4 COMMISSIONER ROWE: Following up on that, there has  
5 been a lot of discussion about Internet network access  
6 points, and that's a term that apparently means a lot of  
7 different things to different people. I would be interested  
8 in comments on what level or quality of external Internet  
9 access might be required; and more specifically, what would  
10 be -- when we say "GigaPop," what's the definition or  
11 definitions?

12 MR. HERBERT: Well, I'm going to hand this to him, and  
13 he'll give you a real technical answer probably. Something  
14 very large, I know that. I think that what Montana is after  
15 is not too dissimilar, though, than what many entities in  
16 Seattle or Denver are after. I mean, exactly the technical  
17 characteristics of that I'm not certain of; but to Lynn's  
18 map and to the good points he makes, you know, we have that  
19 hole. I don't know if we have to have a GigaPop right here,  
20 but we have to have at least some highways to get us to  
21 those locations. Maybe they're toll roads, maybe they're  
22 subsidized somehow so that we have access to those other  
23 locations that can get us out, that cover our distance  
24 problems.

25 DR. CHURCHILL: I guess to try and give a fairly short,

1 concise statement of what a GigaPop is, basically it  
2 involves two major things. Number one is significant  
3 bandwidth from the standpoint of access to probably a  
4 minimum of OC12 connectivity. OC12 is about 640 gigabytes  
5 per second; and when we start looking at that kind of  
6 capacity, it's important to realize that for research, for  
7 what we call IP multicast and those kinds of applications of  
8 high-quality video and other kinds of applications, it's  
9 important to have big pipes.

10 A GigaPop does something else. It also aggregates  
11 providers from the standpoint of Internet providers, such as  
12 the major ones like MCI, View-U-Net, others that are the  
13 major Internet providers of circuits and services that  
14 basically connect the entire world. The major ones that we  
15 talked about are places where those kinds of providers come  
16 together to provide those services to Internet service  
17 providers and to the various telecommunications carriers.

18 So by placing something like that in Montana,  
19 actually my recommendation is that it be a distributed  
20 GigaPop so that we serve -- having aggregation basically to  
21 meet the needs of both eastern and western Montana. Those  
22 distances are significant.

23 And it does something else too. By building two,  
24 you build redundancy; and one of the things that we have to  
25 look at is that being isolated out here, any of our planning

1 should be looking at redundancy so that if one major circuit  
2 goes down or one major center goes down, you're still  
3 operational. So it's in that context that I state if we  
4 plan correctly, I think we can have multiple providers and  
5 be what we call multihomed to more than one major other  
6 gigabyte.

7 COMMISSIONER ROWE: Let's go around one more time. Any  
8 questions here at MSU? In the back. Mr. Feland.

9 COMMISSIONER FELAND: Mr. Commissioner, maybe my  
10 question goes to the FCC or somebody, whoever; but our  
11 invisible LATA line that runs down through the middle of the  
12 state, it seems to me if we could do away with some of that  
13 stuff and allow the competition to cross, maybe it would  
14 help plug that hole that we've got out there. I don't know.  
15 If somebody could answer, Why can't we do it, and who has  
16 the ultimate say on telecommunications, is it the state or  
17 the FCC?

18 COMMISSIONER ROWE: The question is about the LATA  
19 boundary invading Montana east and west and who decides.

20 MR. HERBERT: Well, I'm not sure that I'm the right  
21 person to answer that.

22 COMMISSIONER ROWE: Tony doesn't decide.

23 MR. HERBERT: I believe that's an FCC issue. I think  
24 the FCC put the LATA line in place. I would agree that it  
25 needs to be reviewed. It's been there -- it was a curious
